It is, therefore, not a book of reference, but it takes the student along the various branches of the subject to a point from which, if he wishes to continue, he will be in a position to appreciate and to use the advanced literature and books on the subject. The system of Dana has been followed to a great extent, as that is the book of reference which is largely used by the American student, though other sources have been freely consulted in the compilation of this volume. In Part I, Crystallography, the thirty-two types have been described for completeness, even though there are no minerals crystallizing in some of them. The names used are those of Miers, as they embody the symmetry of the type and thus require very little memory on the part of the student. Dana's names are given in each case under the term class. The old method of deriving the hemihedrons, etc., from the holohedrons has been retained and may meet with criticism, but it is a simple method of determining what forms are possible to combine on crystals of lower symmetry. I have always found it a very material aid to the student, leaving no false impressions. Only graphical methods of solving the problems, after the measurement of a crystal, are given, and the mathematical solutions are left to the more...
