White lead results which is washed from the unaltered lead. The water of hydration which may be present in white lead often causes blowing. It has a specific gravity of 6.1 to 6.2. Sublimed white lead is not what the name implies, a carbonate of lead, but is a basic sulphate. Its use is increasing in favor as it does not tend to produce blowing. It accelerates more than white lead, and produces a black product when vulcanized. It is a velvety powder and mixes readily with the rubber. It has a slightly higher density than white lead. Red lead, or minium, is the tetroxide of lead, or really it may be thought of as a mixture of lead monoxide and dioxide. $2 \text{PbO} \rightarrow \text{Pb}_2\text{O}_3$ (Red Lead) It is made by heating litharge in a reverberatory furnace at a temperature of 450 deg. C., but must not be allowed to melt. The best grade is made by heating the monoxide of lead with sodium nitrate in an oxidizing flame to a dark red heat. It has a specific gravity of 8.6 to 9. It is one of the most powerful inorganic accelerators, perhaps due to the heat of reaction between it and the sulphur. It is used in rapid curing stocks. It can be used only within certain limits as it will attack the rubber as a result of its strong oxidizing power....
